The following table shows the results of the regression analysis for the dependent variable "Number of children" (Y) against the independent variable "Age" (X). The regression equation is $Y = 0.15X + 1.2$. The coefficient of determination is $R^2 = 0.85$. The standard error of the estimate is 0.3. The t-statistic for the slope coefficient is 4.5, and the p-value is 0.0001. The intercept is 1.2, with a standard error of 0.1 and a t-statistic of 12.0, with a p-value of 0.0001.

The following table shows the results of the regression analysis for the dependent variable "Number of children" (Y-axis) and the independent variable "Age" (X-axis). The table includes the regression equation, the coefficient of determination (R-squared), and the p-value for the regression coefficient.

The following table shows the results of the regression analysis for the dependent variable "Number of children" (in thousands). The independent variables are "Year" (1990, 1995, 2000, 2005, 2010, 2015, 2020) and "Gender" (Male, Female). The results are presented in the following table:

The following table shows the results of the regression analysis for the dependent variable "Number of children" (in thousands). The independent variables are "Year" (1990, 1995, 2000, 2005, 2010, 2015, 2020) and "Gender" (Male, Female). The coefficients are estimated using ordinary least squares (OLS). The standard errors are shown in parentheses below the coefficients. The adjusted R-squared value is 0.85.
